

MANUFACTURERS WARRANTY COMPLIANCE ASSESSMENT

FOSSIL PLANT SUPPORT

Value Delivered

- ✓ Critical examination of warranty compliance requirements
- ✓ Detailed assessment of warranty requirement implementation
- ✓ Standardized approach, assessment plan, & reporting
- ✓ Clear, functional report with summary of requirements & compliance determinations
- ✓ Careful oversight to ensure the effective application of warranty requirements

Industry Challenge

Major power plant water/steam cycle components include a warranty generally containing various chemistry monitoring requirements and operational limits—though many plants are unaware of these requirements. Often plant chemistry programs do not properly reflect these requirements, and the plant operates outside the values prescribed by the manufacturer. But without the proper application of manufacturer warranty requirements, undetected problems can escalate, leading to corrosion issues and even costly equipment failure.

ChemStaff Solution

The experts at ChemStaff can meet this challenge with decades of power plant experience and deep industry knowledge. Our practiced professionals critically evaluate both implementation and compliance with manufacturer warranty requirements for chemistry sampling and analysis as well as system chemistry controls at fossil plants.

At ChemStaff, we locate, review, and compile applicable warranties for assessment, while our highly trained specialists provide careful oversight to ensure the effective application of warranty requirements. We also deliver a functional, simplified warranty requirements matrix expertly developed to be integrated into plant procedures along with a detailed report, including a summary of requirements and compliance determinations.
